ObjectARX is a COM-based API based on the architecture of the Microsoft Component Object Model (COM) and it is a standalone component that doesn't require a user's AutoCAD installation to function. With ObjectARX, a custom application can utilize AutoCAD functionalities without AutoCAD or Python being installed. This eliminates the need for installing Visual LISP or VBA components that are often very large and difficult to update as the software is updated. ObjectARX can also run in the context of the AutoCAD R14 or later host application and can communicate with it over the network or by serial port. This allows for integration with other software without the requirement of hardware changes or extensive programming to connect the software. Other platforms with ObjectARX support Embarcadero RAD Studio XE8, XE9, XE10 Embarcadero Cross-platform.NET Framework 2.0 application with user interface Microsoft VBA/Powerbuilder Visual Basic for Applications (VBA) and PowerBuilder are the two most popular programming languages for Microsoft Windows. They are Microsoft products that run on Windows platforms. In addition to being used in AutoCAD, these languages are used to create standalone applications and are the primary tool for application creation. VBA (Visual Basic for Applications) allows scripts to be run within the AutoCAD application itself. VBA (Visual Basic for Applications) is an object-oriented scripting language that can also be used to create stand-alone applications on Windows. Scripts can be executed from the command line, an external application, or as macros within the drawing itself. VBA scripts are used to automate manual operations. VBA is typically associated with the Windows operating system, although it can run on Microsoft Windows and DOS-based operating systems (such as MS-DOS, Windows 3.1 and Windows NT 3.51). PowerBuilder is an object-oriented programming (OOP) application development language built around the Paradox database for client/server and database applications. PowerBuilder, with its visual interface builder and other tools, is used to create client/server and database applications. With PowerBuilder, code can be written in one language and compiled into object files (of different types). This makes it easier to maintain code than with traditional programming languages, which generate machine language for the processor.
