There is no wrapper around the assembly itself in which I can add a reference to the C# project, but I'd prefer not to add such a wrapper if at all possible. If it's possible to simply call the assembly from within C#, is it possible to pass parameters between the two using Reflection? A: In general you want to avoid this. It's probably better to add a reference to your assembly and simply call methods exposed by that assembly. If you absolutely want to do this... First, if you're in the same domain as the calling assembly you can get a reference to it using reflection and call methods directly: Assembly callingAssembly = typeof(CallingClass).Assembly; MethodInfo method = callingAssembly.GetMethod("MyMethodName"); object[] parameters = new object[] { "param1", "param2" }; object result = method.Invoke(null, parameters); But keep in mind this may cause problems because it will cause the calling assembly to require other assemblies. If you want to avoid this and avoid a wrapper class it's probably better to build an interface, then expose an interface from the original assembly and build a wrapper and reference that. A: If you put the assembly dll inside the bin folder (or another folder which you dont place in 09e8f5149f
