AUDIO: Play Cursor keys, delete, backspace, Enter, Page Up, Page Down, mouse wheel, Home, End and Enter With Windows 7 and Windows 8, Microsoft introduced a new type of tool called Universal Windows Platform (UWP). Most applications that come with these versions of Windows are Universal Windows Applications, meaning they run on any Windows platform including Windows desktop, Windows Phone and Windows 10 Mobile. But this has caused many designers to ask: how should they approach the development of UWP applications and when is it appropriate to use them? Today, we'll be tackling this topic and try to explore the pros and cons of designing UWP applications. So, let's get started! First, what's a UWP? The term "Universal Windows Platform" refers to the platform in which Universal Windows applications run. Windows 10 itself is built on this same universal platform, and most applications developed for it run on Windows desktop, Windows Phone and Windows 10 Mobile. To explain this more clearly, think of it this way: the code to make a UWP application doesn't care if it runs on desktop, phone, or tablet, it just needs to run on Windows

10 itself. A lot of the UWP development process is handled by Microsoft Visual Studio. As long as you install Visual Studio, you can start developing UWP apps for Windows 10 (and you might even get it as part of the Visual Studio install package). Visual Studio has a dedicated Windows 10 section, and most of the relevant settings and features are found here. This article focuses on the Universal Windows Platform as well, and you can find out more about it here. When should I develop an UWP app? Before you decide whether to go for UWP development, it's important to understand why this development model exists and what it does. It was introduced to bridge the gap between the mobile and desktop application worlds, since Microsoft felt there was a great need for a more unified development environment for app creation on all platforms.
