My algorithm is working properly. However, I'm trying to find the best value for "in_weights" and "out_weights" parameters. As a performance indicator I choose to look at the overall accuracy. When I check my data I see that the weights I used achieve a higher accuracy in the training set but I am stuck finding a value for "in_weights" and "out_weights" that will make the algorithm perform better on the validation set. I would like to have a value that would generalize well on a validation set. What weighting method should I use in this case? A: There are a few ways to weight your inputs. You could have inputs which are "more important" and another set that are "less important" in determining the output of your network. This is how most neural networks are trained by default and is the method you are using. You could have two equally weighted inputs and an output, then treat the output as the sum of the two inputs. Or you could have an "average" of the two inputs and an output. Or you could have any weight you like for each input and an output. Since your label is binary, you could have two inputs which are "either positive or negative", however with two inputs of equal importance, the neural network would still be better than a random guess. As for the weights, I would suggest only one weight per input and one weight per output. A JUMBO named KURT THE DOG is the star of a new UK comedy play and has had to be chained up outside a butcher's shop near his home, as he is so popular it is feared he might rush in to devour some elderly customers. KURT THE DOG is a giant, 11lb Rottweiler dog who makes a dash for his owner's shop, a butcher's shop, as he is overjoyed to

(Mumu / The year 2000 can be found on the DVD inside the box.)As if they haven't already had their share of ups and downs, the Mighty Ducks of Anaheim are gearing up for their first

Calder Cup Final in franchise history. But while the Ducks are enjoying a run of playoff success, one of their most notable differences from the other half of the Pacific Division is the goalie situation. Oliver Ekman-Larsson, the Arizona Coyotes' star defenseman and co-leading scorer of the postseason, finds himself on the opposite side of the ice in Wednesday night's Game 7. Ekman-Larsson, a former Mighty Duck, found himself on the ice for almost 52 minutes in Game 6, the shortest in Ducks history. Yet, the Coyotes netminder still ranks second in minutes played and first in shots faced in the series, getting the call in the Ducks' 3-1 defeat on Saturday night. "He's a great competitor," Ducks head coach Randy Carlyle said. "He's a tough guy, he's a strong guy. In many ways he's a more complete player, because you can't see him around the puck all the time. He's a puck-possession player. He's strong on pucks. He's extremely skilled with a quick release." Ekman-Larsson is also the player most responsible for creating the first round of the Ducks-Coyotes series. In Game 3, he won a foot race 3e33713323
