2D and 3D design In AutoCAD and other CAD systems, each object is represented by a collection of vertices connected to each other. When the user creates a 3D model, the program creates a 3D surface that represents all the faces that intersect with each other at their vertices. The CAD system uses this surface as a grid, in which lines and arcs are drawn. As with any drawing tool, 2D and 3D views can be projected and exported in several formats, including: DXF files, the format standard for CAD drawings. Shapefiles, an extension of the GIS format. AutoCAD MEP, a format specific to mechanical engineering. AutoCAD native format, a proprietary format. The native format is an XML file that stores all the geometry of the model in a hierarchy. One or more instances of the native format are stored for each drawing created in the native format. For each instance, the native format stores the attributes of all the geometry of the drawing, and also all the layers and filters used in the drawing. Using the native format, it is possible to create a tool to search within a native drawing for specific information. For instance, if the drawing contains a library of sections, it can be searched to identify the type of each section. This allows specialized tools that help CAD professionals design mechanical parts, while optimizing the time spent on a design and the quality of the finished product. As of 2016, Autodesk no longer publishes the native format. Because Autodesk uses a hierarchical XML format for native format drawings, they can also be viewed and edited as XML documents. This makes it easier to modify a drawing, while preserving the integrity of the drawing. Storage AutoCAD is sold with a number of storage formats, including DXF,
