Objects are most often used to represent physical, structural, or architectural features of a design, and to separate different types of information in a drawing. Objects can also be used to represent entire drawings, including entire sections, plans, elevations, and sections. Each of the AutoCAD Object types has a distinct purpose, and thus AutoCAD provides many types of objects. Some of these objects are also divided into separate categories, called component types, as shown in Table 1. Some objects have multiple component types. Table 1. Command Line Processor (CLP) The Command Line Processor (CLP) can be used to automate the drawing process. It is a command-line interface which gives users the capability to create new objects with Python code. The command line makes it easier to create new functions and "tools", (visualizations) that will be embedded into the drawing process. It is based on the Python programming language and command-line interface, which is included in the Windows operating system,. The CLP environment does not rely on AutoCAD Cracked Accounts's own API and can be used in any CAD system that supports Python. Opencascade Autodesk released Opencascade as a successor to AutoCAD LT. Opencascade is a research and development project of the software company Tecnomatix. It is an open source architecture based on ObjectARX. The goal of the project is to give CAD developers the possibility to make higher level decisions by using the power of the ObjectARX class library and the Lua scripting engine of AutoLISP. While OpenCascade is a free software, it contains patent rights which cover usage within the scope of the license agreement. However, Autodesk maintains no control over Opencascade's development and opens it to the public on an ongoing basis. In contrast to most open source CAD software, OpenCascade is based on Tecnomatix Class Library (Tcl), which is a C-language scripting language.
