Although I am an active member here, please do not reply to the email address listed in the headers. As the title already states: the application supports the conversion of icons from files belonging to several file formats, including BMP, JPG and PNG. The application has been tested on the majority of file types and does not appear to be affected by any of the file formats mentioned. I was finally able to get the process to work. You do have to remove any empty lines from the PNG files with a text editor like Notepad. It has been a while since I made this, so there could be a chance that something was missed. The icon that is displayed in the right panel in the first screenshot is not displayed on the second screenshot. Is this a bug? Are all icons in the same size? Is the placement of the icons in the second screenshot "correct"? Also, how do you save the converted icons? On the previous version there was a button labeled "Export", but there is no such button in the version I have now. Very nice

What's New In DLL2ICO?

DLL2ICO is a free utility designed to extract icons from Windows DLL and EXE files. Being a small and fast utility, this application is meant to be as a base for more advanced solutions. If you find bugs, please report them. If you don't find them, send me an email with the names of the icons in the form of keywords and I will release updates to it. There are only a couple of icons that are missing from the current version, so if you use the application regularly, you will never have to miss any icons. DLL2ICO works in similar fashion to the popular Icon Recorder that is available in almost all shareware distribution packages. This means that it will also be able to replace the original icons in the system using it. (It does not work in all cases - see the file help for more information on that). Most icons that are being extracted are 16x16 - 22x22 pixels, but you are free to change the size of the extracted icons. The extracted icons are saved in a TAR.GZ file with the same name as the DLL or EXE file. How does it work? Find the directory that contains the files with the icons you want to extract. Find the filename of the icons in the directory and type them to the text box. Click Extract. The application will produce a folder with the extracted icons and it will be placed in the same directory as the original icons. Start the application. You can select the size of the icons to be used in the "Compression" setting. It is better to use the highest compression settings to maximize the file size to reduce the chance of getting an oversize file that would be too large to upload. The extraction process may take a while, especially if the file contains a lot of icons. But the time will not be measured in minutes, but in seconds. The application does not modify any Windows settings. If you are running the application in Windows 95 (or higher) it will leave all settings intact. But in Windows NT/2000/XP you will need to have "Unrestricted Access" for files with extended attributes enabled in the security settings. Otherwise the application may not be able to extract files from the file system. You can easily convert the icons into PNG format using any image program that supports "convert to a format" (such as Paint Shop Pro)
