Origin is making the long awaited prequel,

Bloodborne: The New Legend, on PlayStation 4 in September. In this isometric action role-playing game, you take up the role of the hunter, a new arrival in the cursed city of Yharnam. The first of a new breed of man, you have been brought in to cleanse the city of the horrors that have taken root there. However, as prey becomes fierce and traps multiply, can you stay alive long enough to find out who sent you, and why? Discover the delights of navigating and combat that will keep you on the edge of your seat. New thrilling challenges await you, as you go in search of the meaning of the bizarre life and death game.

You can take on the role of a hunter, seeking out vampire blood to survive. Let nothing stand in your way as you explore the dark metropolis of Yharnam. Chase down your prey as you put your new supernatural abilities to the test. Slaughter and protect those you love in an unforgiving, modern day role-playing world.

Character creation features three massive character classes to choose from. The first class will unlock as you play, while the other two are all-new and have never been seen before.

knowledge, this is the first study to
combine ^{18}F -fluoride PET/CT and
magnetic resonance imaging (MRI) for
brain tumor detection. Both MRI and
 ^{18}F -fluoride PET/CT were successfully
integrated into our brain tumor detection
protocol, and effective brain tumor
detection rates were obtained. The first
study investigating ^{18}F -fluoride
PET/CT used F-2-fluorodeoxyglucose
(^{18}F -FDG) for the detection of brain
tumors and found that PET/CT enabled
improved detection rate of brain tumors,
namely 20 to 80% ([@B14], [@B15]). The
high uptake of ^{18}F -FDG in brain
tumors has been explained by the high
rate of cell division, proliferation and
high glucose metabolism, which are
characteristic of brain tumors. However,
 ^{18}F -FDG is taken up in the brain
capillary endothelial cells or pericytes as
well as in brain tumor cells, and is
scarcely taken up in normal brain
parenchyma except in the grey matter
([@B1]). Therefore, the uptake of ^{18}F -
FDG in the brain is generally lower than
that of ^{18}F -fluoride. In addition,
PET/CT with ^{18}F -fluoride is not related**

to other therapy, such as surgery or radiotherapy, unlike other positron emission tomography tracers. ¹⁸F-fluoride was first reported in 1991 by
