column, and a method for driving the same. A solid-state imaging device is equipped with a sensor array, each pixel of which has a photoelectric conversion element and a vertical signal line connected to the photoelectric conversion element. This sensor array is a two-dimensional array consisting of a large number of photoelectric conversion elements. In a case where the solid-state imaging device has the photoelectric conversion element, a photoelectric transfer gate, and a vertical signal line connected to them, a light quantity sensor having a photoelectric transfer gate and a vertical signal line connected to them is disposed between photoelectric transfer gates. With this structure, the light quantity sensor for detecting the incident light can be disposed in the same plane as the photoelectric conversion elements. The solid-state imaging device is formed into a one-dimensional or two-dimensional array by disposing the photoelectric conversion elements and the light quantity sensors of a plurality of stages. Each pixel of the solid-state imaging device reads signal charges (photoelectric charges) accumulated in the photoelectric conversion element by turning on the transfer gate connected to the photoelectric conversion element, and outputs the signal charges through the vertical signal line. In general, the transfer gate is ON for reading the signal charges of one row at a time, in a solid-state imaging device, and the vertical signal
