Innsane is a 3D remake of the cult game "Logical" from the Amiga days. It's all about balls and twist locks. You have to arrange the balls in the right order to pick the lock. What sounds simple enough quickly turns out to be a uniquely tricky game. Collect four balls of the same color in a twist lock and blow them up. To beat a level, you have to pick each lock at least once. Every level adds new elements like traffic lights, one-way streets and color changers, and you also have to keep an eye out for the indestructible black balls! Innsane features 50 exciting levels that really get your brains working. The difficultly increases progressively. Its initial levels are easy, but!nsane rapidly becomes an absorbing and addictively intricate puzzle!News McConnell hopes to pass unemployment extension as soon as possible WASHINGTON — Senate Majority Leader Mitch McConnell said the Senate will vote as soon as possible to continue extending an unemployment benefits program that expires Thursday for the unemployed and jobless. If you wouldn't mind, I'll give you some instructions on how to arrange the openings better. The audience should feel as if they're the ones on stage and they're expressing their message, not us. It should be perceived as their song. I was trying to decide which original track I should use for the lesson, as it was my best feeling one. Despite the many terms that were thrown at you in that text, you're right on track. You don't have to pay attention to the details, which is the left and right follow-up ways, as that's the default layout. One of the changes that was made was the channeler's hand positions. Which is the last picture I listed. The whole practice is based on that principle. The chord you're playing tells the rest of the tracks

What's new in Unicorns On Unicycles:

 IPs article may be of interest to you. ====== mhartl I was actually trying to find a good layman's primer on this topic, before getting sucked into the gory but fun-to-read (and play) details. Thanks. For the first time, engineers have precisely targeted a gene in Drosophila fruit fly embryos and changed the sequence to produce a new protein. They also may have silenced a gene that is involved with a type of cancer in mice; preliminary results from tests in mice have shown that the cancer is more susceptible to the treatment if the gene is not functioning. The work is from two independent groups, that each published its research on Feb. 28 in Science. The project was funded by the German cancer research association and the Ministry of Education and Research, the companion ministries of the European Union. The human genome contains about 20,000 genes, and most of the time these genes are inactive. In some types of cancer, however, the genome's machinery is turned on to produce proteins that aid tumor growth. But many proteins are involved in normal body functions, and scientists don't want them to be produced if the cells are being treated to fight cancer. To prevent this "byproduct" of cancer from being produced, in the first tumor-fighting project the researchers used a virus that targets genes by actually binding to a precise sequence in the genome and destroying the gene when it finds that particular sequence. The researchers called the new kind of antisense molecules "gene drive" after the mechanism of inheritance of the gene. The Drosophila researchers used this method to modify the gene drosophila genes drosophila to produce a protein that they wanted to be inactive in the fly's fruit fly embryos. The project used a pair of gene drive elements, allowing the team to change the sequence of the gene and turn off production of the unwanted protein. In the tumor-fighting work, the scientists used a pair of gene drive

elements, but they modified them differently. One of the modifications disabled a cancer-promoting gene called Myc, turning off Myc protein production and causing the fruit flies to be more susceptible to cancer. The other element disabled a gene called Cas9, causing its possible use and production of the Cas9 RNA or protein to be reduced by more than 99 percent. The tumor-fighting fruit flies were treated with drugs that slow growth and
