In a review of the major chemotherapeutic regimes for patients with multiple myeloma (MM), those regimes which have shown to be of benefit include standard VAD, cyclophosphamide/doxorubicin/dexamethasone (CADT) and high dose melphalan/radiotherapy/involved field resection (HDM/RFR). We have reviewed the efficacy of pamidronate in these cases and in patients treated for primary and metastatic lesions. Pamidronate is thought to be active at different levels in the myeloma cascade. Initial data have shown pamidronate to be effective in the control of osteolytic lesions, improving appetite and marrow function. Further more, there is a modest survival benefit in patients who are unresponsive to other therapies.Q: Converting a column of lists to a list with indices I have a column with a list: array([['a', 'b', 'c'], ['a', 'b
