now you can open, view, and work with edit decision lists (edls) in edius 7.5 and maintain the same workflow between footage and edls that youve come to love. edius features a broad range of important new editing functionality, such as the ability to edit keyframes, apply split-frames in the timeline, and use edls in conjunction with timelines. it also has a refined interface and an improved look and feel to help you edit more efficiently. edius 7.5 also lets you easily manage a vast quantity of footage by placing it directly on the timeline in a non-linear fashion. with edius, you can create a timeline from video clips, audio clips, or any combination of the two. the timeline can be subdivided into clips and tracks. you can then load and view clips in the same or different timelines. the properties of the clips are preserved when they are moved to a different timeline. for instance, you can work with a keyframe on an audio clip and make a

change to that keyframe on the timeline, and the change will be carried over to the audio clip. the edius timeline allows you to make a variety of basic and advanced editing changes, such as fading in and out, applying keyframes, splitting clips, and more. you can perform basic editing tasks by making line adjustments and adding video effects, audio effects, or video and audio transitions. you can perform more advanced editing tasks, such as joining multiple timelines together, using snap to keyframes, using keyframes, and joining multiple video clips together. you can also use the timeline to group media clips and trim a video clip down to a specific length. 5ec8ef588b
