Keymacro helps to change the text color of any widget of Yahoo Widget Engine File Size: 1.4 mbThis application claims the priority of Korean Patent Application No. 2003-43683, filed on Jul. 28, 2003, in the Korean Intellectual Property Office, the disclosure of which is incorporated herein in its entirety by reference. 1. Field of the Invention The present invention relates to an apparatus and method of data encryption for a wireless receiver, and more particularly, to an apparatus and method of data encryption for a receiver operating in a wireless communication system using code division multiple access (CDMA). 2. Description of the Related Art A receiver of a wireless communication system, such as a personal communication system (PCS), has a function of receiving a signal and of decoding data contained in the received signal. The receiver processes data transmitted from a base station in the wireless communication system and thus requires a decoder. Therefore, it is necessary to provide a decoder at a receiver side. A method of transmitting and receiving data using a single decoder is well known as an effective method of data communication. It is called a single decoder, a single decoder method, or a single decoder decoding scheme. The single decoder may increase the efficiency of a communication system. In order to process data that are modulated at different communication rates in a single decoder, a coding scheme of different bits should be performed in the single decoder. The coding scheme of different bits can be applied when the communication rates are different. That is, different coding schemes of different bits can be applied to data having different communication rates. The different coding schemes of different bits can be divided into two categories. A first coding scheme of different bits is a coding scheme of a fixed length bit for a data bit to be transmitted, and a second coding scheme of different bits is a coding scheme of a variable length bit for a data bit to be transmitted. A conventional apparatus for transmitting and receiving data using a single decoder requires a fixed length coding scheme for a data bit to be transmitted. Therefore, the data bit to be transmitted from a transmitter has a fixed length, but the data bit to be transmitted from a receiver has a variable length. A receiver operating in a wireless communication system using CDMA requires information of data modulation for data to be transmitted from a transmitter in order to demodulate a received signal. A method of data modulation for a single decoder and a method of data demodulation for 2edc1e01e8

**System Requirements:**

**\*\*DOES NOT INSTALL THE PRINTABLE SEED\*\*** System requirements include: Intel CPU: 4 GB RAM 16 GB Disk Space DirectX 9.0c, V-sync, VSync, Triple Buffered Screen, Pixel Shader 3.0 Atheros AR5007EG (RTL8192SU), Atheros AR9285 (Ralink RT5370), Atheros AR9280, Atheros AR9380 (Supporting firmware version 2.6.0 or later) NVIDIA
