You can choose to use one of the 10 pre-defined presets or you can try a different crop each time you use this tool. You can even use the photo's file size as a guide. You can now create custom sliders from image adjustments and use Auto Levels tool to automatically adjust the lightness, dark, and contrast. You can also turn this image enhancement tool on and off. In this case, the launch of Photoshop in the cloud means the software can now run just about anywhere. Another advantage of saving your files online is the ability to upload and edit them in a less restrictive work environment. The cloud ensures that neither client nor IT departments have full control over what is being created, and that information and privacy are protected. In fact, instead of trying to figure out how to edit the file on your computer at home, you can share it via a web browser and let Photoshop do the work for you. The upshot of this philosophy is that you can quickly edit documents on any computer via the web or your mobile devices. There's also a number of key advantages that come with the automation of many of the usual processes of photo manipulation. In this environment, you can quickly and easily upload your documents, connect with and collaborate with others, and make changes without any of the usual hassles of version control. Among the new features, we're also promised that Adobe will further bolster your security with additional image protection features. For example, you'll be able to monitor what images are being sent and received to ensure they arrive intact, and you'll also have the option of encrypting sensitive areas of documents to make sure they are transmitted securely. A new feature called Darkroom is also due to arrive. Darkroom is built with security in mind, offering a secure platform for working with large file sizes. Watch the Adobe UK page for more information about Darkroom.
