I've been testing Lightroom 5 since I received a preview copy a few weeks ago. I've taken a lot of photos with it, and it is much more intuitive than previous versions. I've tried exporting my images to both DNG and CR2, and I always have a good feeling the resulting images look great. This is a huge boon to this workflow, as the export quality is sometimes going to look the best when converting to a DNG format. In order to really get my teeth into testing things, I've been editing a large selection of photos. I've used the Library module quite a bit, and I found that kind of useful in any case. I was pleasantly surprised by the improvements they made in the display. The section has been greatly expanded, and it now has a smart display mode. You can zoom in and out and scroll back and forth on all screens. Other small improvements include auto-sizing a selection to keep it a nice constant size on the screen. If you make a selection and press "Select", the cursor reverts back to a regular one. If you then make a new selection, it will automatically connect to the original one. Also, a new "Connect to Reference" button in the photo editor now allows for easy selection of reference images in either DNG or CRW. I'm no diehard Adobe fan, but the company has released a sophisticated new program: Photoshop Elements 2021. Which offers a lot of features and more than 1,000 filters; plus a robust video editor. It's a great way to create easy-to-share digital keepsakes. It's for those who want to edit photos and videos, particularly in the areas of wedding and event photography.

Occasionally, the most efficient and quickest way of fixing problems with your pictures is to duplicate them and keep, including the problematic ones. The good news is that you can easily save all of those copies so you can go back to them if needed. You can also flip-flop layers as well to change them with any type of changes or edits you decide on. This way, pushing them forward to other layers or back track is made legible. With an image on your screen, press **Ctrl + K** to apply a preset filter effect to the selected area, such as a blur filter or blur effect. While you are still holding down **Ctrl**, you can also apply any of Adobe own presets and effects. Adjust the image to your liking. You can use the Adjuster tool, full-faced eraser, and reposition different parts of the image. You can also apply curves to sharpen or soften edges with any adjustments. Foreground and background can also be separated or added separate to the image or multiply. You can also apply a preset adjustment to an image to make it look different than you would normally. You can opt to do a minor adjustment or a major one, like one where you can add or subtract light and colors. Saving the changes to your layers are done again on the layer or layers with which you want changes to apply and can be changed to any other style of effects that you wish. You can select which layers and create or change erases and isos that will be used differently.
